Acknowledgements and Positionality

We acknowledge the Coast Salish Peoples of the Songhees, Esquimalt, and WSÁNEĆ, Cowichan, and Stzuminus communities on whose unceded and occupied territories we pursue our education and livelihood. We acknowledge that we are the beneficiaries of colonizing policies that have displaced local Indigenous communities from their Traditional Territories and systematically privileged European settlers. As members of the nursing profession, we endeavour to conduct ourselves in ways that respect Indigenous Peoples and take actions that redress Indigenous-specific racism, injustice, and inequities in health care. To critically locate ourselves within the context of this work, each author has provided a brief positionality statement.

Tamarah Braithwaite: I identify as a cis-gender female white settler. I am a first- and third-generation visitor to these lands and am of English, Irish, Scottish, and Welsh descent. I was born on the lands of the Lhtako Dene Nation and have been a visitor on the Coast Salish lands since 1993. I identify my position as a visitor here and acknowledge with respect the Lekwungen-speaking Peoples on whose lands I have had the honour to seek education. These traditional unceded lands are shadowed by a colonial past and present and I express my profound appreciation at the opportunity as a white settler to participate in this research as an Indigenous ally and to continue to visit on these lands.

Leanne Poitras Kelly: I am highly aware of my privilege of being an educated and socioeconomically advantaged cis-gendered Métis-Cree woman originally from the Qu’appelle Valley in Saskatchewan. I recognize that my relocation to unceded and occupied Coast Salish Territory comes with responsibilities to know my role in giving voice and holding space for my colleagues and friends of this land. To this end, as a visibly Indigenous nurse educator, I am committed to interrogating oppressive systems.

Christina Chakanyuka: I am a cis-gender mother of three originally from the community of Fort Smith, Northwest Territories with strong family ties to my mother’s British, Dene, and Cree-Métis relations as well as my father’s ninth generation Scottish-Canadian settler relations. As a Métis nurse educator occupying space on Coast Salish homelands, I consider it my responsibility to walk softly on this land, listen to and learn from local Knowledge Holders, and engage in everyday actions that uphold local Indigenous Peoples’ rights to self-determination.

Author Relationships

The decision to write together was born out of an opportunity to be co-learners in a small research project. The Jamie Cassels Undergraduate Research Award (JCURA) provides funds to support undergraduate students in research projects that develop knowledge and research skills. At the time of this project inception, Tamarah Braithwaite was a fourth-year undergraduate student with a strong interest in equity and anti-racism. At the time of publication, Tamarah is an RN working fulltime in acute care. Both Leanne Kelly and Christina Chakanyuka are faculty at the University of Victoria, PhD candidates, and novice researchers. The principal investigator for this project was Leanne Kelly; however, throughout our data collection, analysis, and writing process, close communication and collaborative effort between Leanne and Tamarah have been consistent and transparent. Christina Chakanyuka provided early project development support, analysis feedback, and editing support. Our collaborative analysis work reflected insights and discussion from our respective Indigenous and white settler positions.
Method Selection

The authors purposefully chose the western academic method of a survey to gather data based on convenience, novice researcher experience, ease of implementation, minimal infringement on student time, and to fit within the digital strategies used during the pandemic. This project provided an opportunity for our team to learn together with straightforward methods that could provide opportunity to work through the research process. The authors acknowledge that there are other ways to conduct research that challenge western linear processes; however, for this small initial project, intentional choices were made to utilize tools that would support our team learning in this way.

We acknowledge with gratitude the BC Campus Research Fellows Grant and the Jamie Cassels Undergraduate Research Award for providing funding for this project.

Introduction

In 2015, the Truth and Reconciliation Commission of Canada (TRC) set out 94 Calls to Action to improve the wellbeing of Indigenous Peoples. Two focus areas of the calls were education and health care, with a specific call (#24) to improve cultural safety education in nursing and medical programs at Canadian universities (TRC, 2015). Specifically, Indigenous-focused “skills-based training in intercultural competency, conflict resolution, human rights, and anti-racism” (TRC, 2015, p. 3). A recent environmental scan of 107 schools of nursing and midwifery in Canada (Metheny & Dion Fletcher, 2021) examined the incorporation of cultural safety content into their programs since the TRC Calls to Action were released. The scan found that less than one-fifth of these schools had publicly displayed evidence on their school websites that indicated they met the criteria. Given the imperative to respond to the ongoing documentation of the impacts of racism on health outcomes, it is critical that nursing education programs develop content in this area and make clear how they are accountable and meeting the goals laid out by the TRC Calls to Action (Allan & Smylie, 2015; Gaudry, 2016; TRC, 2015; Ward et al., 2021).

In response to the TRC Call 24, the Canadian university where this research occurred designed a course (called Understanding Indigenous Health and Wellness) that examines the legacy and impacts of colonization and Indigenous-specific racism on Indigenous health and wellness in Canada. The course seeks to support nursing students to utilize a decolonizing lens to develop culturally safe practice. This project, entitled the “Files of Uncertainties”, builds on the writings of Susan Dion (2007), an Indigenous scholar from York University, where she describes the concept of the “perfect stranger” (p. 330) in relation to the void that often exists between Indigenous communities and settler communities. Dion invites her students to create a file of (un)certainties (p. 334) that positions self-interrogation juxtaposed with Indigenous tropes and learnings at the center of exploration. Our project was created to invite fourth-year nursing students to explore their own experiences of applying decolonizing knowledge learned in the Indigenous wellness course to their practice. This exploration was positioned within the title of “uncertainty” to acknowledge the gaps that exist among non-Indigenous people’s relationship to Indigenous Peoples. As educators, we recognize the complex nature of the intersecting influences of colonization, racism, health care systems, personal positionality, and their influence on nursing praxis. This project provided an opportunity for nursing students to name and reflect on these complexities within a safe and anonymous space and to invite reflection on their work to incorporate decolonizing knowledge into their nursing practice with Indigenous clients.
This paper provides some background and context regarding the need for cultural safety education to be better understood and to substantiate why we developed the Files of Uncertainties research project. We outline our research questions, data collection, and analysis methods. Emergent themes are presented using illustrative exemplars from participants’ narratives. We then discuss the study’s implications and identify areas for future research.

Background

The concept of cultural safety was developed in the 1980s by Māori nurse Irihapeti Ramsden to address Indigenous-specific racism in health care and improve the health and wellbeing of Indigenous Peoples (Ramsden, 2002; Ward, et al., 2016). Despite broad usage of this term within scholarly literature, health equity research around the world provides contemporary evidence that Indigenous Peoples continue to experience poorer health outcomes. They continue to have less access and less satisfaction with health care encounters due to trauma caused by colonialism, systemic oppression, and ongoing racism (Sherwood, 2013; Sherwood & Edwards, 2006; Ward, et al., 2016; Ward, et al., 2021).

While initiatives to incorporate cultural competence and cultural safety education have gained some traction within nursing over the years, (Papps, 2005; Rowan et al., 2013) evidence of Indigenous-specific racism and oppression under dominant white ideologies remains (Green, 2016; Turpel-Lafond, 2020; Ward, et al., 2021). High-profile reports of Indigenous fatalities due to racism in health care continue to surface in Canada. For example, less than five years after Out of Sight documented the death of Brian Sinclair in a Manitoba emergency waiting room (Brian Sinclair Working Group, 2017), a video of the clinician-delivered racist abuse of Joyce Echaquan in a Quebec hospital hours before her death went viral via social media (Shingler, 2020). In British Columbia, the 2020 report In Plain Sight captured personal experiences with racism reported by almost 9,000 respondents and clearly demonstrated the impacts of persistent Indigenous-specific racism in our health care system (Turpel-Lafond, 2020). Given this evidence, there is an urgent need to change health care practice, policy, and education to address systemic racism and advance reconciliation through the creation of partnerships with Indigenous Peoples that uphold Indigenous rights to self-determination (Green, 2016; Sherwood & Edwards, 2006; TRC, 2015; Ward, et al., 2016; Ward, et al., 2021). However, the incidence of racism within the health care system speaks to the complexity of transforming knowledge into practice. As each new cohort of nursing students graduate and begin applying their knowledge, it is imperative that we ensure the issues of racism and decolonizing actions be well-understood and taken up in practical ways.

The academic institution has historically been a hegemonic space that upholds western knowledge systems and patriarchy, thus perpetuating colonialism, oppression, and racism towards those who exist in spaces of difference (Gaudry, 2016; Green, 2016; Metheny & Dion Fletcher, 2021; Turpel-Lafond, 2020). Without intentional exploration of the role of nursing education in disrupting oppressive systems, we posit that nurses will continue to participate in established systems of patriarchy and racism. The critical theory movement asserts that philosophy and social science should “work to free people from political and other forms of oppression” (Dahnke & Dreher, 2016, p. 403). Thus, it is our assertion that until nurses are educated to interrogate western knowledge systems and participate in decolonizing education and practice, Indigenous Peoples will continue to experience racialized interactions that negatively impact health outcomes, community development, self-determination, and cultural expression (Green, 2016; McGibbon et al., 2014; Sherwood, 2013; Sherwood & Edwards, 2006; Smith, 2012; Vukic et al., 2012; Ward, et al., 2016; Ward, et al., 2021).
The Files of Uncertainties Project

Purpose

The purpose of this mixed method study was to provide an opportunity within a safe and anonymous space for nursing students to explore their confidence with and potential feelings of uncertainty about applying decolonizing knowledge to their nursing clinical practice regarding interactions with Indigenous clients. Students were asked to explore and describe their own experience, both successes and challenges, of integrating knowledge into practice. This information would ultimately be valuable in ongoing development of nursing curriculum. This project was approved by the Human Research Ethics Board through the Research Administration Information System at the Canadian university where the research took place.

Method and Data Collection

This study used a western academic framework consisting of a convergent mixed method anonymous online survey with three open-ended short-answer questions and six Likert-scale questions, with an estimated time commitment of 30–60 minutes per participant. Participation in the survey was voluntary and anonymous. The study engaged fourth-year nursing students at a Canadian university who had completed the 1.5 credit 13-week course titled Understanding Indigenous Health and Wellness. Students who had completed the Understanding Indigenous Health and Wellness course and their subsequent spring clinical practice were invited to participate in the study. An email was distributed through the university’s School of Nursing communications to this cohort of 150 senior undergraduate nursing students. No specific demographic information was collected on the identity of the students. Interested student participants were able to follow an internet hyperlink in the nursing school communications email to locate the survey. The participating students were able to contact the third-party administrative assistant who did not teach in the course to discuss consent, information gathering, and study data protection processes. The third-party administrative assistant collected the data electronically via an online survey. All participants were provided with a twenty-dollar gift card as compensation for their time, arranged through the neutral third-party administrative assistant to maintain anonymity.

Consent

All information regarding the project was provided in the letter of information sent to the participants. Potential participants were provided with an anonymous opportunity to ask questions prior to agreeing to participate. The letter of information included details related to implied consent. A specific statement of implied consent was built into the survey and was required to be checked prior to opening the survey for completion. Data were stored electronically in encrypted files on a password-protected server accessed by the neutral third-party administrative assistant and shared securely with the researchers once all identifiers were removed.

Research Questions and Survey Development

The survey questions were developed through discussion between two of the Indigenous faculty members who have been instructors of this material for over 15 years and who have worked within Indigenous communities for the bulk of their nursing careers. The survey tool was used to create an anonymous space for students to reflect and feel unencumbered to explore and voice the uncertainties that exist within the juxtaposed space of Indigeneity, racism, and nursing practice. The questions were posed to allow student exploration of their experience and to name potential
discomfort, tensions, and successes without the influence of grading implications or instructor judgment.

The informal survey consists of two types of questions: three open ended and six Likert style. The open-ended questions were selected to encourage students to draw from their practice experience and reflect on situations that they had encountered. The Likert-scale questions were created based on past nursing instructors’ conversations with students and anonymous student course evaluation comments. They were not pre-tested but were reflective of Understanding Indigenous Health and Wellness course concepts.

Open-ended questions:

1. Think of a scenario in which you (in the role of student nurse) were involved in or observed the care of an Indigenous client within the clinical setting from your Consolidated Practice.
2. What knowledge, skills, awareness, or personal positionality guided or supported your engagement?
3. What questions, tensions, or uncertainties created challenges or hesitation for you in your work?

Six questions on a five-point Likert scale ranging from strongly disagree (1), disagree (2), neutral (3), agree (4), and strongly agree (5) were also asked:

1. As a result of taking Indigenous Health and Wellness, I now feel I have sufficient knowledge of the history of Indigenous-settler relations in Canada to inform my nursing practice.
2. I fully understand the difference between a culturally responsive approach and an anti-racist approach to my nursing interactions with Indigenous Peoples.
3. I feel personal tension or uncertainty when preparing to interact with Indigenous patients/clients in the health care system. (R)
4. I feel personal tension or uncertainty when interacting with Indigenous Peoples outside the health care system. (R)
5. I know how to intervene when I observe or experience racial tensions between Indigenous Peoples and health care workers.
6. White/settler privilege is a concept that I am uncertain about in my personal role in society and my professional practice. (R)

Data Analysis

Data from the completed surveys were initially reviewed by the neutral administrative assistant who was not associated with the School of Nursing and who signed a non-disclosure form. They removed all identifying information and securely forwarded the cleaned and password-protected data to the research team for analysis. Two types of data were collected: qualitative narrative and quantitative Likert scale survey data (De Leon & Chough, 2013; Thorne, 2000). The qualitative narrative analysis was used to examine each student’s answers to the open-ended questions. Constant comparative analysis was used to analyze responses across the participants and generate and consolidate themes in the narrative responses (Smith, 2012; Thorne, 2000). The quantitative survey data had a five-point Likert scale, and scores were reported in frequencies. The
Results

Qualitative Data: Narrative Themes

Sixteen of the 150 senior undergraduate nursing students responded, representing a 10.6% response rate. The 16 nursing student participants provided narrative descriptions of their experiences working with Indigenous patients/clients and completed the survey online anonymously. Eight themes arose from the narratives: (1) mistrust in the health care system and trauma, (2) uncertainty and tension, (3) stereotyping and racism, (4) community and healing supports, (5) power differentials, (6) systems and policy, (7) resource scarcity, and (8) applying the Indigenous-focused course content to practice. Although we created eight separate themes, there is obvious overlap in their creation. For example, power differentials were spoken about in relation to undergraduate student perception of their own power and ability to disrupt but were also influenced by the hierarchal system and policies of institutions that place undergraduate students in a position of lesser power and autonomy.

Mistrust in the Health Care System and Trauma

All but one of the 16 students articulated their awareness of the impacts of historical inequities on Indigenous Peoples’ contemporary relationships with the health system. Students voiced concerns regarding the potential for mistrust of the health care system developing out of harm to Indigenous patients/clients because of Indigenous-specific racism and stereotyping as well as intergenerational and/or historical trauma associated with colonization and residential schools. Students identified the importance of using a trauma-informed care approach to engagement with Indigenous patients/clients. Several of the students noted that past inequitable treatment has led Indigenous Peoples to mistrust the health care system, which could make them reluctant to share sensitive information (e.g., an inability to read a consent form). The students explored their perception of broad issues such as institutional neglect in residential schools and Indian hospitals and the potential for re-traumatization in current settings related to power differentials. One student described a client who had identified their past addiction issues and voiced their reluctance to accept fentanyl prior to a procedure. The student observed staff interactions with the client and felt coercion had been present as staff struggled to convince the patient to consent to narcotic use:

When he went down for his angiogram procedure he was told he would be receiving fentanyl prior to the procedure and did not want it done for fear of becoming addicted to fentanyl… I remember one health care provider trying to persuade him into taking fentanyl and getting the procedure done. (Student participant 8)

I knew that Indigenous clients are already in a vulnerable position when they access health care due to past histories and trauma associated with the health care system and Indigenous individuals. (Student participant 8)

Uncertainty and Tension

Thirteen of the 16 (81.25%) participants acknowledged feeling uncertainty or tension while working with Indigenous patients. Some participants spoke of personal uncertainty as they did not know what questions to ask Indigenous patients, while other participants spoke of uncertainty and tension from “being in the middle” between Indigenous clients and senior colleagues uttering racist
remarks. One of the students said they would have liked earlier education in navigating situations of conflict involving Indigenous patients. Four other students noted they felt ill equipped to deal with situations involving cultural tension during interactions with Indigenous patients and staff members. These responses referred to not having the necessary toolkit early enough in nursing school, not knowing how to ask sensitive questions appropriately, and not knowing how to respond when an Indigenous patient shared traumatic details of their experiences. One of the students related a story in which they felt tension when an Indigenous patient began speaking negatively of other nurses by whom she felt poorly treated. One student also mentioned feeling cultural tension because nursing school “shoved Indigenous knowledge into us” while not providing enough teaching on cultural diversity and transgender or Two-Spirit individuals:

I felt awkward and like I wanted to be able to help more, but I didn’t know how to. Then I questioned that, and thought that providing safe, culturally competent care is one of the most important things I could do. I find it really challenging after learning in so many classes about Indigenous history and challenges in health care, then when I go in these situations I almost always feel like something I am doing is wrong… The more I learn, the more I feel like I am doing something wrong, like nothing I could do would be right. (Student participant 15)

Responses to the Likert questions further indicated that 37.5% (n=6) of the students “somewhat or strongly” agreed that they felt personal tension or uncertainty while interacting with Indigenous Peoples inside the health care system, as compared to 17.75% (n=2.8) outside the health care system.

Stereotyping and Racism

Eleven of 16 students (69%) reported witnessing stereotyping, racist comments, biased hospital policies, or tension related to culture and ethnicity. One student described her own feelings of bias due to “subconscious prejudice” that created racial tension. The student acknowledged that these thoughts and opinions must be addressed and worked through when providing care for Indigenous patients. On the Likert-scale questions, when asked if they understood the difference between a culturally responsive approach (which predominantly considers cultural difference as the reasons for problematic issues) and an anti-racist approach (which considers systemic influences and requires disruption of status quo settler privilege), 81.25% (n=13) of participants stated they somewhat or strongly agreed they had this knowledge. This result aligns with their responses regarding white privilege, where 81.25% (n=13) of participants either somewhat or strongly disagreed that they felt uncertain about their personal and professional role related to this concept. Responses indicate that participants believe they understand the foundational concepts that influence racialized interactions but only one participant’s narrative specifically mentioned an acknowledgement of their privilege directly.

Student narratives also included examples of nurses and other health care staff describing Indigenous patients negatively while alluding to their racial identity. These examples predominantly included generalizations around alcoholism and drug-seeking behaviour or ascribing behaviours to a whole population. Also noteworthy was the mention of four specific examples of stereotyping on a single unit.

I have heard unit nurses mention Indigenous clients with comments such as “this is how it is with them.”… It made me feel gross to hear nurses talking about the client in this way. (Student participant 16)
During this time, I experienced an Indigenous woman admitted for a scheduled procedure. This woman was scared and had the support of her husband at the bedside. I witnessed disgusting actions from the nursing staff when it was brought to their attention that the woman had lice. (Student participant 2)

**Community and Healing Supports**

Nine of the 16 (56%) student participants referred to the value of community and cultural practices in the health and well-being of Indigenous patients. Multiple students acknowledged the importance of sitting with a patient, hearing them, crying with them, and being present when family and community members were unable to be present. One student felt curious and confident enough to ask a patient about the traditional meaning behind a smudge stick and reflected on utilizing trauma-informed skills and approaches to care:

I noticed the patient had a smudge stick resting over their lungs and I asked the patient what the importance of this was to them and their care. The patient told me how it assisted with healing when placed on what body part needed assistance to healing.

Learning about how to have a trauma-informed approach to caring assisted me in this situation. I did this by having the patient be the expert of their history and religion and coming from a cultural humility approach. (Student participant 9)

Another student expressed uncertainty about the risks for re-traumatization when asking questions about culture-specific supports.

I was hesitant to ask about her culture and beliefs, but I would have liked to know looking back because it may have improved her care and assisted her with any other spiritual or other health needs. (Student participant 3)

Students recognized the importance of family and community support and recognized the strengths that clients may have present in these connections:

Their community itself is strong and is something to learn from as it creates strong health and well-being. (Student participant 3)

Involving family in care was also extremely beneficial as their culture is family focused and they could speak to the patient in a language they understood. (Student participant 12)

Some students had the opportunity to engage in clinical practicum placements with Indigenous partners. One student described how much more culturally safe a placement in northern Canada was compared to those in southern BC.

Permanent changes had been made to care delivery methods to ensure culturally safe care was provided. They had a large team of Indigenous nurses / social workers / counsellors, etc., to ensure Indigenous clients felt safe and supported in their health care experiences. (Student participant 4)

**Power Differentials**

From the narratives, almost half, or seven of the 16 students referred to systemic power differentials that impacted Indigenous patients’ sense of power and reported that they had observed situations where Indigenous patients felt afraid to voice concerns to their physicians. These students highlighted their own lack of voice and sense of disempowerment on the unit, which resulted in reluctance to speak up when senior colleagues made derogatory remarks.
As a student nurse, the power differentials between RNs, students, physicians, and patients can make it difficult to speak out when we witness something that doesn’t align with our values and knowledge. (Student participant 5)

I felt torn as I was a student and the idea of correcting a group of nurses seemed frightening. (Student participant 16)

Another thing that I struggle with is that I can only control my behaviour, I have no control over how other care providers or interdisciplinary team members behave or conduct themselves in practice or how other people’s behaviour may impact a client’s care experience. (Student Participant 4)

When asked if they know how to intervene when they observe racialized interactions between health care workers and Indigenous patients, 81.25% (n=13) somewhat or strongly agreed. Alternately, 18.75% (n=3) said they were neutral or somewhat disagreed. This result suggests that most of the students assess themselves as knowledgeable about intervening in racialized interactions; however, within the narratives, several comments indicated uncertainty that influenced the students’ ability to take action.

**Systems and Policy**

Six of the 16 participants described standard or usual processes within the health care setting that reflected agency policy that did not align with Indigenous supports. One of the students related their experience of moral tension between “the policies that guide us and protect us as nurses versus the security and safety of clients” when describing the need for frequent safety checks for a patient who may have benefitted from a less traumatic invasion of her space and privacy. Another student commented on how new COVID-19 policies regarding visitation limits family and community engagement. One student described the negative impact of a policy that disallowed keeping traditional food in the unit fridge, thus limiting a patient’s access to it.

I felt very trapped by this policy and felt it was not fair to deny this patient of this right to comfort and security in the form of cultural healing. (Student participant 11)

**Resource Availability**

Three of the 16 students referred to access to appropriate resources. Examples included the Aboriginal liaison nurse being completely booked and unable to see a patient, the student’s or patient’s lack of knowledge about what resources are available, and a lack of access to important medications such as insulin for some patients who live on reserves:

He said he hadn’t been taking care of his sugars and seemed afraid of judgment because of this. He said it was hard to purchase insulin on the reserve. (Student participant 7)

There are internal/external resources available if patients request them, but they’re spread thin and are not always available or timely. (Student participant 4)

In contrast, two students noted having appropriate access to resources and the ability to provide patients with booklets and supportive referrals.

**Applying the Indigenous-Focused Content to Practice**

All 16 participants related some component of theory education and knowledge of equity issues and social determinants of health in their applied practice with Indigenous patients. For example, some students included practical approaches to wound dressings or pain/pain control and
how pain is experienced individually and can differ across cultures. For others, it was specific learning regarding relational practice, or reflexive practice work in the midst of complexity. Students spoke of the cultural sensitivity ladder (Papps, 2005), development of self-awareness, and acknowledgement of positionality and racial identity. Understanding of intergenerational trauma and use of a trauma-informed care approach came up frequently throughout the narratives: 13 participants (81%) mentioned the importance of knowledge around the use of a trauma-informed lens, impacts of intergenerational trauma, trauma experienced during health care interactions, or ways to establish and respect boundaries to avoid re-traumatization. Student participants acknowledged that throughout nursing school they have developed a working knowledge and ability to understand and apply core concepts such as privilege, health care inequity, racial identity, and power. They also articulated the importance of understanding their own positions in the world in relation to Indigenous clients with whom they may be working. Several students also mentioned in their narratives that nursing classes had supplied them with valuable communication techniques such as models for reflection, the value of silence, active listening, and how to simply be present with a client.

**Summary of Qualitative Data**

The narrative submissions from students were organized into overlapping themes. Overall, students were willing to explore challenging situations in their practice and identified overarching influences that illustrate their experiences. Students had knowledge of the potential for Indigenous client mistrust in the health care system related to past traumatic encounters and legacies of colonization. Students provided evidence of racism and stereotyping among their peers and by clinicians within the health system but did not deeply explore their own role in this aspect of care. Students also identified systems-level challenges such as inability to access client community supports, the scarcity of available resources, and the institutional policies that influence their work on the front lines of health care. At times, students’ comments conveyed a sense of uncertainty when encountering power differentials and a heightened awareness of the unintended consequences of disrupting colleagues they deemed culturally unsafe. Students relied on their knowledge of relational practice, reflexive learning, and anti-racist and critical thinking to assist in applying their knowledge to practice but described experiences where they were not always able to act in ways that yielded a shift towards a culturally safe situation. It is unclear if students lacked confidence in their ability to disrupt racialized situations or felt that external situations were too difficult to navigate independently.

**Quantitative (Likert Scale) Data Summary**

The Likert scale questions were intended to capture student assessment of their own learning and understanding of course content and their ability to apply their knowledge to practice. The questions were based on content that is currently offered in the Indigenous wellness course. Overall, student responses indicate a high degree of understanding of course concepts (see Figures 1 and 2). Results also indicated that there is some uncertainty with applying the knowledge in interactions with Indigenous Peoples in the health care system as described in the narrative themes.

Figure 2

*Questions*

Q1. 87% of respondents feel strongly or somewhat strongly that they have sufficient knowledge of Indigenous-settler relations.

Q2. 81% report understanding the differences between a culturally responsive vs. anti-racist approach to interactions with Indigenous Peoples. This was not clearly demonstrated in the narratives, however.

Q3. 62% strongly or somewhat *disagree* that they feel uncertainty *within* health care system interactions with Indigenous Peoples, which indicates that 37% do feel some degree of uncertainty.

Q4. 81% showed strong disagreement to feelings of uncertainty *outside* the health care system.

Q5. 81% somewhat agree that they know how to intervene to disrupt racial tension and 18% indicate neutrality or uncertainty and no respondents indicate strong agreement.

Q6. 81% strongly or somewhat strongly *disagree* that they feel uncertainty with their understanding of white privilege as it applies to their personal role and professional practice. This suggests that students generally feel they have knowledge and understanding of the concepts important to decolonizing and equity.
Discussion

Experiences with Complex and Racialized Health Encounters

We know that, globally, Indigenous Peoples continue to face concentric, ongoing trauma associated with the lasting impacts of colonial violence and racism. Notwithstanding the core values of equity and justice embraced as central to the discipline of nursing and despite years of cultural safety and anti-racism training, Indigenous Peoples in Canada still experience Indigenous-specific racism and harm when accessing health services today (McGibbon, 2019; Richardson & Murphy, 2018; Turpel-Lafond, 2020).

Nursing students describe their challenges to the use of anti-racist knowledge including present-day biases of their health care provider colleagues, supervisors, and agencies. Evidence shows that Indigenous-specific systemic racism contributes to trauma when accessing health care services. (Sherwood & Edwards, 2006; Turpel-Lafond, 2021; Ward et al., 2016; Ward et al., 2021). Almost 70% of the student participants in this study noted some form of racism, mistreatment, or derogatory comments made by hospital staff that diminished the quality of care received by Indigenous patients. Their reflections support the assertion made by other researchers that state work is still required to reduce harmful racialized health interactions in Canadian health care facilities and reduce race-related health disparities (Hassen et al., 2021; Phillips-Beck et al., 2020; Stout, 2021; Turpel-Lafond, 2021; Wylie, 2019). Most students also agreed that they had the knowledge regarding how to intervene to disrupt racial tensions but the narrative descriptions of their clinical experience illustrate examples in which they felt powerless to intervene.

Student narratives provide examples of ongoing tensions such as the difficulty in accessing diabetes medication, agency policies that deny patients traditional food sources, and denigrating attitudes towards patients with complex personal circumstances demonstrate ongoing issues relating to equity and respectful engagement. Students made comments such as “I felt awkward,” “I felt gross,” or “I felt trapped,” in relation to not being able to provide the most culturally safe care. Student responses to two of the Likert-style questions indicate a difference in how students perceive their interactions with Indigenous Peoples inside and outside of the health care system. Perhaps this is due to the higher stakes students place on being culturally safe and the professional responsibility of their nursing role, the gravity of which can add to a sense of moral distress. This is further exacerbated by the existence of power differentials, lack of voice, hospital policies, and systemic racism. Similar distress is documented in research in which nurses are confronted with the unaddressed social determinants of health influences such as poverty, housing, and powerlessness (Wros, et al., 2021), as well as confronting the predominant contemporary Canadian narrative of multiculturalism, inclusivity, and tolerance promoted in our daily interactions in society and which we implicitly support within our nursing profession to the exclusion of addressing individual and systemic racism. (Hilario, et al., 2018; Varcoe, et al., 2019). These testimonies underscore the continued potential for health care services to be unsafe and traumatic spaces for Indigenous Peoples.

Indigenous Health as Required Curriculum

In their report Bringing Reconciliation to Healthcare in Canada: Wise Practices for Healthcare Leaders, Richardson and Murphy (2018) conclude that there is still much work to be done in recognizing Indigenous Peoples’ rights to self-determination in health and wellness programming. They identify three interrelated priority objectives for health care leaders seeking to advance reconciliation including to “re-align authorities, accountabilities, and resources;
eliminate racism and increase cultural safety; and ensure equitable access to health care” (Richardson & Murphy, 2018, p. 1). This directive speaks to the pressing work that must be undertaken to develop curricular content in nursing that will result in the understanding and uptake of cultural safety work. It requires a shift from a pathological and racialized construct of Indigenous health and culture to one in which health care providers look inward and critically examine their personal role in supporting oppressive societal structures. It is critical that providers understand how their own positionality, bias, power, privilege, and worldview shape how they walk in the world and impact those around them (Gaudry, 2016; Green, 2016; Ward et al., 2016; Ward et al., 2021). Students who had completed the Indigenous wellness course were given the opportunity to engage with critical race theory, colonization, and Indigenous community knowledge and reflect on the value of integrating these concepts into practice. Although the survey demonstrated majority support for this work, there remained some uncertainty in student confidence to disrupt racialized interactions and to feel fully prepared for interactions with Indigenous clients. This could imply the need to support their professional growth in this regard or to interrogate their reliance on relational practice. As nurse educators continue to develop content to address racial inequities, we must find ways to increase comprehension and uptake of critical knowledge that results in improved clinical environments for Indigenous patients/clients (Bell & Dalen-Smith, 2021; Garland & Batty, 2021; Kennedy, et al., 2021).

Limitations of the Project

The qualitative component of this research had a sample size of 16 participants who provided rich narrative descriptions of their experience and had consistent overlap in themes and insights. This supports the researcher view that this sample met accepted standards for qualitative sample size adequacy as discussed by Vasilieu et al. (2018). The ability to make inferences with the quantitative survey results was limited, however, by its small sample size. We also did not know the participants’ baseline knowledge related to the survey questions to be able to determine a change in scores pre-post course. The low numbers of respondents to the quantitative survey may also indicate respondent bias of those students who are actively interested in this content knowledge. Researchers also acknowledge that Question 6 should have been separated into two questions addressing personal and professional roles separately. There was also no participant demographic information collected in order to maintain anonymity, but this aspect of information may have added to the discussion and implications of the data.

There were also some limitations embedded within our overall choice of survey as our data collection method. Gaining qualitative narrative data through survey limits follow up discussions with participants, the ability to probe more deeply and engage in relational learning that may be experienced if we were using an alternate method. Anonymous data collection also limits the ability to incorporate participant positionality and reflection on personal worldview influences. Future methodology considerations may include shifting to an Indigenous methodology such as visiting, storytelling, or circle work.

Conclusion

The purpose of this mixed method study was to provide an opportunity within a safe and anonymous space for nursing students to explore their own confidence and potential feelings of uncertainty while applying decolonizing knowledge to their nursing clinical practice regarding interactions with Indigenous clients. Students were asked to explore and describe their own experience, both successes and challenges, of integrating knowledge into practice.
Survey respondents spoke about their observations with colleagues in complex racialized scenarios, as well as about system challenges, relationships with Indigenous Peoples, and the strengths present within Indigenous healing and community supports.

Overall, students acknowledged that Indigenous content in the core nursing curriculum was beneficial and improved their knowledge and confidence regarding Indigenous history, health, culture, community, and traditional practices. Students commented on the presence of Indigenous wellness practices and supports in acute care settings and their own understanding of the value of these practices to the patient. They also identified the limitations they experienced through system issues such as client mistrust, resource scarcity, and power differentials. Some students also commented that, despite the knowledge they had acquired through the course, they continued to experience uncertainty with regards to engaging with difficult and complex situations like trauma history or disrupting racial tension on the unit.

As educators, our reflection on the participant responses indicates that there is an optimistic enthusiasm for decolonizing knowledge of Indigenous contexts. Respondents want to build anti-racism and equity into their practice. We also see that some uncertainty exists when applying this knowledge to practice, which speaks to the onus on educators to support students to develop skills in application. Despite many students’ narratives containing dismay examples of stereotyping, racism, disrespect, and discrimination, the Likert scale responses indicated students’ positive self assessment with the learning outcomes and students’ positive descriptions of their experiences as allies and advocates for Indigenous Peoples, which indicates the possibility of a more culturally safe and inclusive future.

Future research would benefit from expanded input from students to capture diverse experiences and reflections. This might include further development of the quantitative survey that could capture the knowledge to practice concepts under study. Including demographic information on respondents would also assist in gaining insight into the complex reflections on the experiences of Black and People of Colour (BPOC) and the relationship with Indigenous communities. In addition, refinement of survey questions with pre-testing may strengthen the content validity of the data.

Other research might include:

- Further explore the reasons for uncertainty and potential supports as perceived by students.
- Explore the placement of content such as trauma-informed care, critical race theory, and Indigenous Knowledge within the sequence of nursing curriculum.
- Explore in greater depth student comprehension of culturally responsive approaches to care vs. uptake of anti-racist and critical race theories.
- Study specific agency/unit cultures, contexts, and the supports and barriers to maintaining an anti-racist nursing practice tailored to specific environments.

Appendix A

Concept Definition

Anti-racist
An approach that considers systemic influences and requires disruption of the status quo of settler privilege. (St Denis, 2017)

Culture
“The accumulated socially acquired result of shared geography, time, ideas and human experience” (Ramsden, 2002, p. 111).

Cultural Safety
A term and framework developed by Irihapeti Ramsden to invoke thought around power differentials in relation to patient care and outcomes allowing each patient to determine what is safe for them: “Cultural Safety is simply a mechanism which allows the consumer to say whether or not our service is safe for them to approach and use. Safety is a subjective word deliberately chosen to give the power to the consumer. Designed as an educational process by Māori, it is given as a koha to all people who are different from the service providers whether by gender, sexual orientation, economic and educational status, age, or ethnicity. It is about the analysis of power and not the customs and habits of anybody. In the future it must be the patient who makes the final statement about the quality of care which they receive.” (Ramsden, 2002, p. 181).

Cultural Sensitivity
“Alerts students to the legitimacy of difference and begins a process of self-exploration as the powerful bearers of their own life experience and realities and the impact this may have on others” (Ramsden, 2002, p. 117). Often used interchangeably with cultural safety but actually holds the place prior to achieving cultural safety.

Culturally Responsive
An approach that considers cultural differences as reasons for problematic issues to arise (St. Denis, 2017).

Personal Tension
Intrinsic unease felt by nursing students around their personal beliefs, values, and uncertainties in relation to providing care for Indigenous patients.

Uncertainty
In this project, uncertainty refers specifically to the feelings experienced by nursing students when reflecting on their own self-interrogation and interactions with Indigeneity, racism, and nursing practice. Our use of the term builds on Dion’s (2007) work in which she invites her students to create a file of (un)certainties (p. 334) that positions self-interrogation juxtaposed with Indigenous tropes and learnings at the center of exploration. Within our nursing context, we utilize uncertainty to invite students to explore complex situations in which the course of action may not always be apparent or easily navigated.
Cultural Tension

We have utilized cultural tension to indicate the uncertainty or unease that may be experienced by nursing students related specifically to the interactions between nurses and clients of diverse racialized/ethnic backgrounds. Cultural tension need not only imply a negative interaction but one of uncertainty regarding ways for nurses to interact and support clients that do not “offend” or “trigger” a negative experience for the client. Cultural tension has been defined in the literature as an individual experiencing tension between their own culture and that of the dominant culture of the society or organization in which they live/work (Chung Yan, 2008).
